Abstract

This chapter follows individual voter flows using panel data for Social Democrats in Germany (1984-2018), the United Kingdom (1990-2018) and Switzerland (1999-2018). In doing so it speaks to the arguments presented in the chapter by Abou-Chadi & Wagner but provides a long-running trend across individuals and almost 40 years. More specifically, we try to understand where initial voters of the Social Democrats are today. We find: 1) Social Democrats manage to keep some of their core 2) but a lot of their core gets de-mobilized or moves on to more progressive options (Greens, LibDem, Green Liberal Party). 3) SDs struggle in all countries to attract new voters, less so in Switzerland which we think is at least partly due to the progressive offer provided by the SP. In contrast, the German SPD loses to everyone and gains almost nothing.

1 Introduction

Originating from one of the key cleavages of political contestation (Rokkan [1970](#)), Social Democrats have been at the heart and center of politics in Western Europe; and so has their voter appeal and base. Yet their place at the center of voters' minds changed fundamentally with many Social Democratic parties losing large vote shares at least since the early 2000s for various reasons.

From this perspective an enormous amount of research has been created analyzing how party competition in general, elite responses to public opinion shifts, coalition formation processes and more exogenous events like climate change have minimised the electoral appeal of Social Democratic parties. Overall, thus, we have a quite rich understanding about the factors contributing to the decline of Social Democracy – be they cultural or economical. Interestingly, though, we still lack an answer to

one of the key questions implicitly standing behind all these research questions: with which parties did former Social Democrats end up with? Put differently: where are all the Social Democrats today?

While empirically few answers have been given, scholarly and journalistic work is rich in allegations. The most common public narrative is that former Social Democrats first got de-aligned from the party and in the next step defected to the radical right. Social Democrats themselves have also been taken in by many of these perspectives when their party leaders suggest that listening to some specific voter segment – be they the left behind, the unemployed, the rural regions or the cosmopolitans – will eventually enhance their electoral fortunes.

Many of these allegations are not based upon theoretically founded scholarly work (for more on this also see the chapter by Abou-Chadi & Wagner in this book), but appear to be rather *ad hoc* post-theorizing of Social Democrats' losses. In essence, two perspectives exist on what has happened to Social Democratic support. These perspectives have in common that they build on a key empirical observation about Social Democracy: the idea that the classical working-class voter we have in mind when talking about Social Democratic voters no longer exist (Betz 1994; De Lange 2007; Gingrich and Häusermann 2015; Kurer 2020). This in turn provided a challenge for Social Democrats, their leaders and programmatic appeals; namely the challenge to provide a unified programmatic offer for an ever more heterogeneous voter base. This challenge is then understood as the key cause leading to decline of Social Democracy.

The first perspective then suggests that due to Social Democrats' programmatic appeals becoming ever more liberal on the second, societal dimension, Social Democrats have lost their base within the remaining working class. These working class voters were then eventually picked up by the Radical Right – also because of their welfare chauvinist offers. This argument has become an often recited “fact” both by the media as well as Social Democrats themselves.

The second perspective, admittedly far less prominent, is that Social Democrats lost voters to abstention – fairly independent of their programmatic appeals (Streeck and Schäfer 2013; Evans and Tilley 2017; Schäfer and Zürn 2021). Building on theoretical arguments on de-alignment (Dalton and Wattenberg 2000; Dalton, Flanagan, and Beck 1984), the mechanism standing behind this hypothesis is that Social Democrats simply got de-aligned from their party and either never re-aligned or moved on to various parties.

1 Introduction

In this chapter we seek to speak to this debate by introducing – to the best of our knowledge – for the first time valid empirical evidence to this debate by relying on long-run panel data. We study the individual-level voting flows of the Social Democrats' core voters using long-running individual panel data from Germany (1983-2018), the United Kingdom (1990-2018) and Switzerland (1999-2018). We identify the original voters of Social Democrats in all three countries and follow their voting transitions until today.

In contrast to the public narrative we find little support that Social Democrats are defecting to one particular party. Our findings indicate that Social Democrats lose their voters in all directions, but that most former Social Democrats appear to be the de-mobilized voters of today. If anything, Social Democrats in all three countries flowed to progressive options – the Greens in Germany, the Liberal Democrats in the UK and the Green Liberal Party in Switzerland. Even more worrisome: in all three countries the Social Democrats struggle to attract “new voters”. This pattern is strongest for the German SPD: the SPD loses its core without finding means to attract “new voters”.

Taken together these findings make it difficult to believe that Social Democrats control their fortunes. Having control would mean that Social Democrats can derive strategies leading to electoral gains. However, our findings suggest that such a winning strategy is far from obvious for Social Democrats today. On the one hand, it seems clear that across all three countries a progressive alternative on the societal dimension seems attractive for Social Democratic voters. Thus, it is key that Social Democrats develop a programmatic offer not only addressing this societal dimension prominently but also indicating clear positions on topics such as the environment, gender equality and LGBTQ rights. Also, our findings for the Swiss case – where losses are somewhat less pronounced – seem to underline the need for a stronger inclusion of the societal dimension of political competition. On the other hand, the flows of voters leaving Social Democrats today allude that in some regards Social Democracy might be outdated for voters as most of their core left and got de-mobilized; specifically the German SPD loses to everyone without gaining anything. The most pessimistic reading of these flows is that there might not be much room to manoeuvre today, that Social Democrats missed the right moment in time to adapt their policy offers.

2 Where are all the Social Democrats: mechanisms behind the decline

A fundamental mechanism in work on party behavior is the idea that through their programmatic offers – but also through personal and other means – political parties can attract voters (Downs 1957; Strøm 1990; Müller and Strøm 1999). Most prominently Downs (1957) introduced political science to the idea that much like product offers in an economy, political offer via ideological positions is the key means to attract voters (customers). The idea standing behind such arguments is simple: parties provide a program and voters decide which programmatic offer fits their interests best.

Building on this original work a rich body of research investigates how parties' programmatic offer relates to voters (for an overview: Adams 2012). Leaving methodological challenges and question of cause and effect aside, this research finds that in many ways political parties are mostly in an equilibrium with their voters (Adams et al. 2004); and if they are not parties eventually seem to adapt to the interest of the masses (Adams, Haupt, and Stoll 2008; Bischof and Wagner 2017; for a contrary finding see: O'Grady and Abou-Chadi 2019).

In the case of Social Democrats, however, pundits and scholars emphasize that the strong ties between their voters, programmatic appeals and leaders has been seriously damaged in the last thirty years. Social Democrats have been facing a long-running electoral crisis: starting in the 1980s their slow but steady decline started (Przeworski and Sprague 1986; Kitschelt 1994), interrupted by a peak during the late 1990s, the Social Democrats today are no longer the mass parties classical work on party cleavages had in mind when referring to them. Admittedly the Social Democrats still are at the center of policy making in coalition governments; but frequently as junior coalition partners.

Current research provides several explanations as to why Social Democrats are losing: the decline (and split) of the working class (Gingrich and Häusermann 2015; Kurer 2020; Evans and Tilley 2017), the politics of capitalism more generally (Beramendi et al. 2015), globalization shocks (Kriesi et al. 2008; Colantone and Stanig 2018), "backlash" to market liberal politics (Schwander and Manow 2017), more general patterns of de- and re-alignment to new competitors (Koelble 1991; Gidron 2020; Kitschelt 1994) and programmatic adaptation to new competitors (Hjorth 2020; Krause, Cohen, and Abou-Chadi 2020).

Interestingly, existing scholarly work leaves one important question aside: where are all the former Social democrats today? In our reading of the literature the answer to this question lies at

the heart of the entire research agenda on the decline of Social Democrats. The few exceptions that do address that question rely on data – mostly cross-sectional data – and methods that make it hard to learn about the voting history of former Social Democrats. Much like the chapter by Abou-Chadi & Wagner in this book, current research relies on voting recall questions (Krause, Cohen, and Abou-Chadi 2020; Karreth, Polk, and Allen 2013; Cohen and Krause 2020). By nature such data only allows us to learn about the short term voter flows between two elections; but the question at hand seems particularly interesting from a long-term perspective. Some scholarly work even relies on geographical clustered data – such as election results on the district (Schwander and Manow 2017) or national level (Benedetto, Hix, and Mastrococco 2020) – and draws conclusion about transitions. Such approaches are prone to ecological fallacies and cannot feasibly make claims about voter transitions.

3 Where are all the Social Democrats: theoretical perspectives

Theoretically, answering this question is fundamental to draw conclusions on how Social Democrats can deal with their decline. After all we need to know with which parties former Social Democrats ended up with in order to understand how Social Democracy can return to the electoral center of politics.

The decline of Social Democracy was already foreshadowed in classical work by Przeworski and Sprague (1986) and Kitschelt (1994). Most prominently Kitschelt emphasized the increasingly heterogeneous social and economic backgrounds of the former working class (Kitschelt 1994: 23-27). This in turn – but also other factors such as generational change –, he argued, should lead to an increasing polarization of political preferences, in particular to the raise of a second dimension of political conflict – what we here call the societal dimension.

The most significant change coming along with the societal dimension are new challengers: all across Western Europe Green and new Radical Right parties emerged. In addition, some Social Democrats face challenges from left-wing competitors on the economic dimension as well – e.g. the German SPD is confronted with the Linke. Furthermore, all Social Democrats are affected by patterns of de-alignment (Dalton and Wattenberg 2000; Dalton, Flanagan, and Beck 1984); which means that fewer and fewer core voters still reliably support the Social Democrats. The traditional class cleavage, on which their core voting potential has historically been based upon, no longer exists and has

undergone profound reconfiguration.

A first theoretical perspective in line with the public narrative is the idea of a “*detour effect*” to the Radical Right. As it seems unlikely that Social Democrats *directly* flock towards the Radical Right – because that would mean jumping from the left block all the way directly to the extreme right –, this narrative starts from the idea that in the first stage voters become de-aligned from Social Democrats. The mechanism standing behind such a de-alignment can be multifaceted; voters might just as well no longer sense representation by Social Democracy as the arguments suggest in (Kitschelt 1994). In the second step then, these former Social Democrats are understood to still hold traditional working class values, with a preference for strong welfare states and redistribution at its core. Given that most Social Democrats¹ no longer offer such traditional programs, these voters are searching for a new party representing these values. They are then understood to eventually find representation of their values in Radical Right parties with their welfare chauvinist positions.

However, this narrative leaves at least two key theoretical aspects untouched and both speak against the *detour effect*. First, they tend to ignore the societal dimension of political conflict. This is crucial as it seems rather unlikely that traditional Social Democrats are attracted in large numbers by xenophobic and homophobic rhetoric; quite on the contrary it seems more likely that such positions are a major reason core Social Democrats refuse to vote for the Radical Right. Second and related, the values of modern day working class might be much more progressive on the societal dimension than the narrative suggests. As predicted by Kitschelt (1994) today’s working class have heterogeneous preferences. On top of that, many workers themselves have a migration background within their family or a history of seeking refuge. All of this makes it unlikely that we observe such a *detour effect* to the Radical Right.

Instead of a *detour effect* a direct switch towards other parties is also theoretically plausible. In particular voters with long-lasting preferences for more progressive policies on the societal dimension might be attracted by new challenger parties such as the Greens. Thus, these voters are likely to immediately move on towards the Greens; in particular in the German case where a left alternative was missed by many voters due to party and employment bans of communists (Bischof and Valentim 2021).

¹Danish Social Democrats might be the key outlier here.

A second theoretical perspective sticks with the first stage of the *detour effect*: Social Democrats abstain from elections and de-align from politics altogether (Streeck and Schäfer 2013; Evans and Tilley 2017). In ever more unequal societies it appears rational for specific voter segments to abstain from elections altogether: politically unaddressed inequality signals to poorer voters that their preferences tend to be neglected while in turn richer voters and their preferences tend to be represented by most party systems (Bartels 2008; Peters and Ensink 2015). This should then result in decreasing turnout, abstention and de-alignment from politics. It should also predominantly affect traditional Social Democrats who sense that the third way politics of most Social Democratic parties meant a dramatic turn away from their policy preferences; the lack of descriptive and substantive representation of these traditional working class voters results in their abstention in large numbers.

4 Data & cases

4.1 Data

To learn about the longterm transitions of Social Democratic voting we need to observe the same individuals for a long time period. Previous research has not relied on longterm panel data. We do so by relying on socio-economic panels from Germany, the United Kingdom and Switzerland. Given the interest of the panels – mainly economic – using this data comes with some drawbacks we will discuss below, but most importantly to our knowledge they are the only sources which can be used to investigate individual voting records in a long running perspective.

4.2 Case selection

Our case selection is pragmatic; the countries we study are the only ones in Western Europe conducting long running and large panel studies. However, we believe that the three countries provide interesting variation to study patterns of Social Democratic decline. The German SPD, the British Labour party and the Swiss SP provide an excellent snapshot of quite different Social Democratic party organizations. While all three of them originate from the classical Rokkanian cleavage mobilizing around capital (owner) versus workers, the SP never had the electoral size of its sister parties – which is mostly due to the party and electoral system in Switzerland. However, its importance for policy-making and governing is comparable. All three of them are struggling (in different degrees) to maintain

their vote shares and face severe electoral challenges particularly on the second dimension, most notably by Green parties. In the UK and Switzerland, socially liberal and more center-oriented parties add an additional element of electoral competition from the LibDems and the Green-Liberal party, respectively. Also in all three countries, there has emerged a notable competitor on the radical right, which allows to empirically examine the relevance of the often-claimed alleged voter transitions from Left to (radical) Right. Finally, different institutional set-ups and distinct programmatic profiles in the three countries under consideration allow us to some extent to assess which voter transitions from Social Democratic parties to competitors are conditional on the electoral system and the specific ideological orientation of the party.

4.3 Our panel data, our coding decisions

The analyses in this chapter will focus on description only. What we want to understand are the individual voting trajectories across time as such; we do not seek to correlate them with individual level characteristics neither do we want to explain them. Instead, we believe that it is key to provide a rich and meaningful description of how former Social Democratic voters vote today and what this means for parties' strategies.

Our study is based upon four individual level panel studies. All three of them are of high quality, and ensure representation on the national level. Table 1 gives an overview of the panels we included, the time span we analyze, and the number of Social Democrats included in our analysis. As can be

Table 1: Data sources and sample sizes

country	panel	time span	Obs. total	original panelists	original SDs
Germany	German Socio-Economic Panel (GSOEP)	1984 - 2018	689,005	12,290	2,186
United Kingdom	British Household Panel Survey (BHPS)	1990 - 2008	238,996	10,264	2,800
	Understanding Society (UKHLS)	2009 - 2018	75,439	11,778	
Switzerland	Swiss Household Panel (SHP)	1999 - 2018	156,516	7,799	1,488

seen the number of respondents we analyze varies across cases, but is sufficiently large across all three countries as can be seen in the last column of table 1. In the UK we essentially rely on two panels – the BHPS and the UKHLS. The UKHLS continues the data collection efforts of the BHPS in most regards and we made sure to only include respondents in the UKHLS which were already part of the BHPS' original data collection efforts.

To conduct our analyses we need a consistent identification of the Social Democrats “core” voters across time and space. We decided to use a conservative strategy and define a Social Democratic voter as one who *repeatedly* votes for the Social Democrats. In all three countries, thus, we use the survey years falling into the first election cycle and define Social Democratic voters as those who report to would vote for the Social Democrats across the *entire* cycle.² We then use this sample of respondents and follow their trajectory across all election years contained in each panel. We also used different definitions not yet reported in this version of the chapter; reassuringly the major patterns we report are unaffected by this coding decision.

Besides these larger trends across time we also seek to understand the lifetime cycle of all voters. To do so, we report the *first* and *their* last voting behavior recorded for all of our panelists. We are fully aware that this is a tremendous simplification of their voting habits as it ignores any within changes throughout a respondents’ life. Yet, it pictures the beginning and end of voting for parties in a very effective way.

While the three panels allow us to understand voting trajectories across a long time span for a rich amount of respondents it comes with important limitations. First, not all panel studies report voting across the entire study period. The GSOEP only does so in 2018 and 2014. Instead we have to rely on a question which is more related to party identification than voting; respondents are asked to name “the party they support”. Party identification and voting are not the same, but in the case of the Social Democrats in Germany highly correlated. Both in 2014 and 2018 85% of respondents with a SPD party identification report to have voted for the SPD. Thus, clearly the measure comes with measurement error but given the strong correlation with voting we are reasonably certain the cross time patterns are sufficiently approximated. Also, the patterns we uncover for the SPD using party identification align very much to the patterns we find when looking into reported voting in 2014 and 2018 only. To then identify the SPD’s core voters we use not only the fact that respondents support the SPD, but also how strong they state this support is on a five point scale. We then rely only on those respondents who a) support the SPD and b) state to be at least a four on the five point strength scale. In contrast to GSOEP BHPS and SHP report voting and, thus, we rely on standard voting questions for both countries.³ The major drawback is of course that far less people have a

²These cycles are: 1983-1986 for Germany, 1991-1992 for the UK, 1999 for Switzerland.

³To be precise we rely on a standard voting question for the SHP, and a questions about “which party have you voted

party identification than people turn out at elections.

Second, while all three panels are sufficiently large for our analyses, eventually all panels end either because respondents drop out or because they die. Since we want to follow the voting patterns of “original Social Democrats” this means that panel attrition makes the number of respondents included across time shrink. To visually address this we re-calculated the percentages for each year such that it sums to 100 %. Yet, almost all patterns we outline below seem to be more general trends. Thus, we can be fairly certain that they are not subject to biases due to panel attrition.

5 Findings

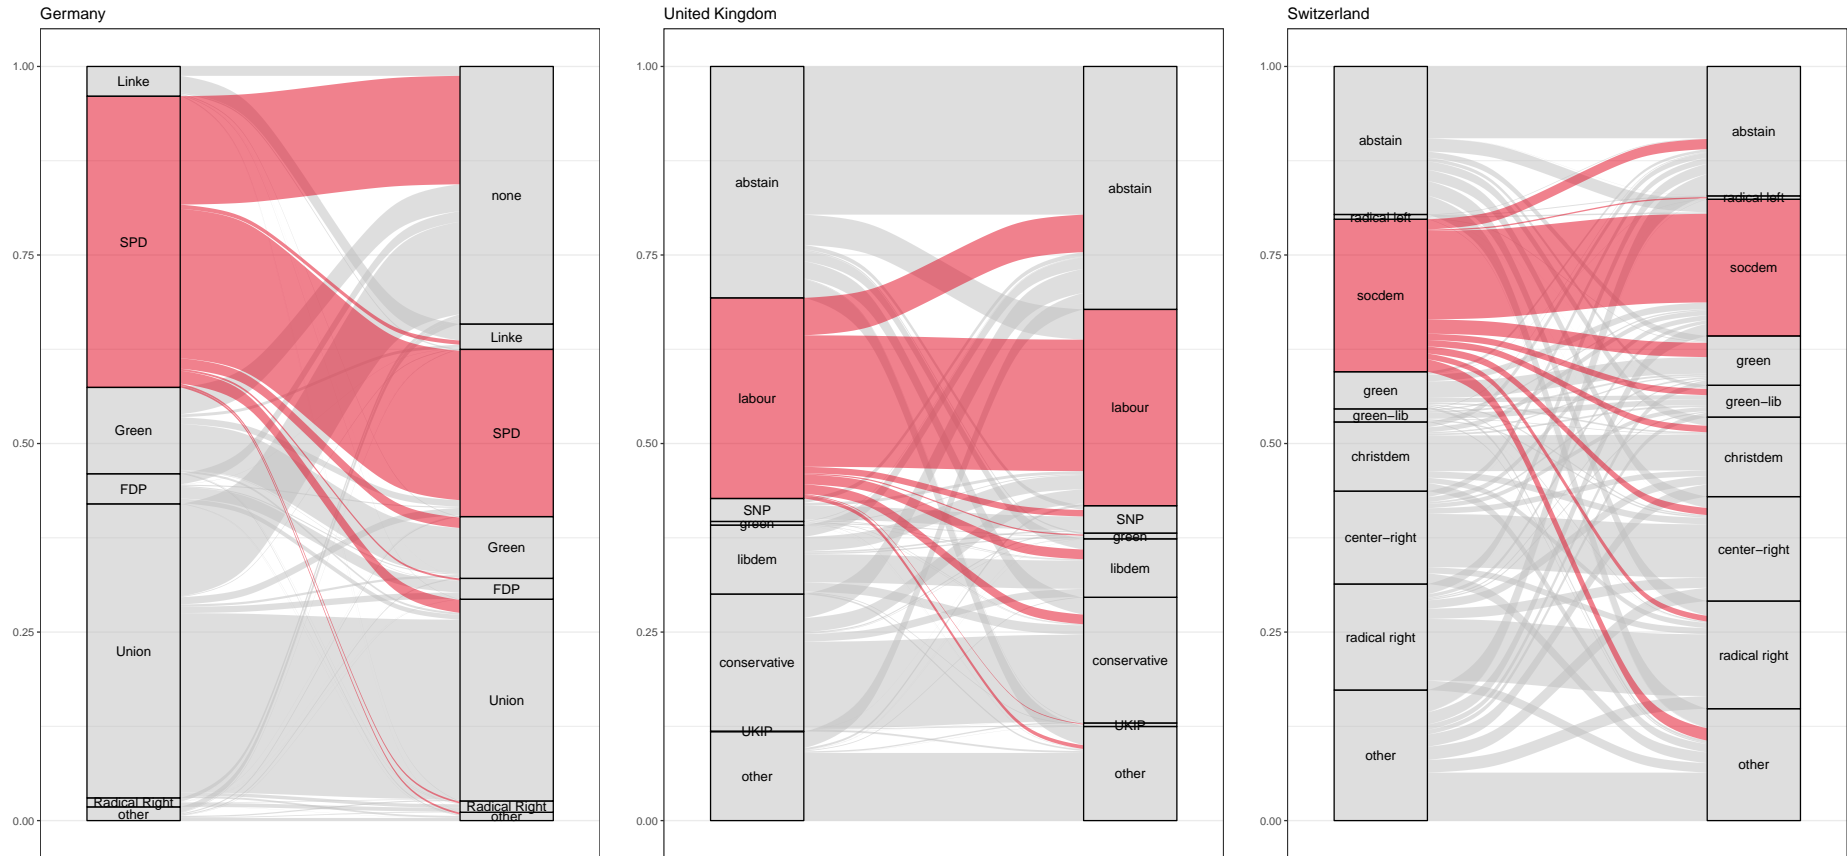

We start our analysis by looking into the lifetime voting cycles for all respondents included in our panels – more than half a million respondents. For each respondent we kept the first and last reported voting behavior. Note that we thus collapse quite different time intervals between two within-subject observations: while for some respondents who participate in the SOEP since the 1980s we will look at very long-term (non)transitions, for other respondents the displayed transition only captures a few years. The probability of an out-transition obviously increases with the duration of this interval. By design, the presented flow charts hence represents a weighted average of the varying transition probabilities over time.

Figure 1 reports these lifetime transitions for all countries included in our study. What becomes immediately visible across all countries is the similarity in the patterns away from the Social Democratic parties. The major message is that original Social Democrats are de-mobilized. They increasingly abstain from elections. This patterns is strongest in Germany – but the extent of the flow in Germany is to some extent certainly a function of the party identification measure. Nevertheless, the largest amount of British Social Democrats also abstains from elections. Only in Switzerland is the loss to abstention comparable in size to the amount of voters leaving for the Greens.

Also in Germany, a sizable amount of voters leaves to the Green party. Equally in the UK Social Democrats transition to the LibDems. Largely due to the electoral system the Greens have never been a viable option to vote for in the UK under the perspective of strategy voting arguments. Therefore,

for in the last election” in the UK. The reason for doing so is that the standard voting question in the BHPS is only shown after several filters are applied and we have reason to assume that this biases the sample towards more political interested only.

Figure 1: Transition away from Social Democrats, across entire lifespan

we read this as a common pattern across all three countries: the most attractive option to defect to are parties which are programmatically progressive on the societal dimension issues. This pattern stands out most in Switzerland where the Social Democratic core shifts to both the Green and the Green Liberal party.

Interestingly, both the Swiss SP and the British Labour party are still successfully keeping and mobilizing large amounts of their core voters. Much in contrast, the German SPD struggles to keep its core voters and also does not manage to attract new voters. This is again different for the British and Swiss Social Democrats, which more successfully mobilize new voters along with attracting voters from all of their competitors. But the transition trajectories for the German SPD are alarming and are much in line with its recent electoral decline: the SPD cannot attract new voters and struggles to mobilize its original core.

What becomes evident across all three cases is that the public narrative of original Social Democrats' de-alignment and re-alignment into the radical right is nowhere to be found. To be sharp: such voters exist, but not in large amounts. Yet, in all three cases they occur in numbers according to our data, which are electorally close to irrelevant. The largest threat from competitors is the progressive option on the societal dimension, in particular Green parties.

How do the Social Democrats handle their complex environments so far? Both Labour as well as the SP do reasonably well. They manage to mobilize their core, while attracting outsiders. The SP so far stands out as the success story, while the German SPD is lost in transition. It faces severe challenges on both key dimensions of party competition. Thereby it also suffers from its history; the split of the Lafontaine group and the rise of a strong competitor on the first dimension. On the second dimension the Green party leaves them also with a stronger challenger, which today is on its way to take over the role of the Social Democrats as the second largest party in Germany.

5.1 Transitions through time

The first part of our analyses used a "big brush approach" in which we pooled respondents across time to get a very general understanding of the pattern of voter transitions. The second part takes the temporal dimension more seriously and looks into transitions of all Social Democrats in our data across each election. For the next set of analyses, we focus on the group of original Social Democratic

voters in the first available wave of each panel data set. we define original core voters as those who have a strong (at least 8 out of 10) Social Democratic party identification in Germany and the UK and those who have voted three times in a row for Social Democrats in Switzerland (due to missing party ID information). We then plot the voter flows between elections over time. The bars always capture the total number of remaining panel respondents who originally supported the Social Democrats along with their updated party identification or vote intention.

We start the second part of the chapter with the Swiss case because of the particularly large number of effective parties and, hence, potential competitors for the Social Democrats. The Swiss panel started in 1999 with a total of 1488 respondents who we define as core supporters of the Social Democratic party. Following this cohort for four years until the next general election, we can see that about a quarter of them abandon the party. The largest share moved to the Green party, which in Switzerland has an almost identical ideological profile but differs somewhat in terms of issue saliency, most notably on environmental issues. A similarly large group of former Social Democratic voters indicates that they support “other” parties, which in most cases means that they gave their vote to a mixed group of politicians from different parties (“vote for persons, not a party”) rather than submitting the Social Democratic list to the ballot. Finally, more marginal segments of voters defect in all other directions including a small but non-negligible group of voters who directly moves to the other end of the ideological spectrum and votes for the radical right Swiss People Party who continued their rapid growth at that time.

Four years later, in 2007, the pattern largely resembles the one of the previous election with the Greens capturing a particularly relevant share of former Social Democratic votes. 2011 brought the party entry of a new competitor, the Green-Liberals, a more centrist environmental party. Interestingly, their successful entrance mainly came at the cost of the Green party and did not hurt the Social democrats substantially at that time. 2015 represents the consolidation of this pattern with the votes of the Social Democratic defectors almost evenly split across all the possible competitors. All in all, most former Social Democrats remained within the left bloc only about 24% eventually moved on to the right bloc.

Much in contrast to the Swiss SP, both the British Labour party as well as the German SPD went through a period of radical programmatic renewal – the Third Way. Both party leaders at the time (late

Figure 2: Transition away from SP, across elections

Switzerland

1990s), Tony Blair and Gerhard Schröder, “modernized” their party mainly on the economic dimension by proposing and adopting liberal market policies. To be fair, at least in the case of Schröder this period was also marked by a period in government with the Green party and, thus, similar shifts on societal dimension issues – particularly the phase-out from nuclear energy. So, these programmatic shifts should potentially also show us a quite different pattern of voting transitions than in the Swiss case. Specifically so, because this period is at the core of the public “*detour effect*” narrative.

Yet, what we find first for the UK, shown in Figure 3, aligns in most regards with the patterns in the Swiss case. Again, voters get de-mobilized – but mostly in the first two election cycles (1997, 2001) we analyze. Interestingly, this is the period during which Tony Blair and his Third Way dominated the party. Thus, it appears that at least to some degree these policies might have driven voters away from Labour.

But what is then much alike to the Swiss case, is the defection to the “progressive option” – LibDem. All in all even less voters moved away from the left bloc and joined the right: all in all about 20% of former Labour voters moved to the right with only a small fraction eventually voting for UKIP (3% - 5%).

In our last case, shown in Figure 4, we focus on the German case. In the first part of the analyses we finished with a rather pessimistic view for the German SPD. Yet, the transitions across elections reveal a similar picture. From the beginning of our analysis the SPD struggles to mobilize its core, and from the beginning their core defects to the Green party. In 1987, the Greens just entered the German parliament one election cycle ago in 1983. They are a young party, often still perceived as a protest party which is incapable to “deliver” policies. But Social Democratic voters appear to be attracted by this option much from its beginning but also in considerably smaller numbers than in Switzerland and the UK. This is very interesting as at the time in many ways environmental concerns were perceived as being incompatible with policies for the working class: how to offer environmental policies and at the same time ensure that factories and companies keep running? Yet, in contrast to the former two countries, the SPD’s case seems exemplary for the abstention argument: supporters leave the party but then also never return to any political party identification. They seem to abstain from politics altogether and in large numbers.

Apart from de-alignment and the Green defection the SPD seems to be spared from competition

5 Findings

for its core voters by other parties. Former Social Democrats do not defect to the right in large numbers, neither to the Linke. This means that the SPD is incapable in mobilizing its core as well as keeping their core from defecting to the Greens. Yet, there is good news: this means that much like the SP a more progressive platform on the societal dimension could keep voters from defecting to the Greens while competition on the first dimension – such as welfare chauvinism – might not be relevant to keep voters from defecting to the right and left extremes. But we need to keep in mind that the first analyses showed that the SPD barely has any inflows from other parties; thus, it might be too late to keep the SPD alive.

This becomes also drastically clear in our last figure – Figure 5. Here we focus on the last two German elections and rely on reported voting by respondents. We do this in order to show two things.

Figure 5: The threat of new party entry from the right, AfD Germany

First, that the patterns here align well with the findings above based on party identification instead of voting. Second, the radical right party AfD entered the German political arena in 2013 as a mainly Eurosceptic party – but lines of radical right policies became relevant shortly after the 2013 elections. This means that the AfD started to offer the policies which allegedly drove former SPD voters to it in

6 Conclusion

between the two elections. Again, we do not find such a flow to the AfD. The SPD loses more of its 2013 voters to the Christian Democrats, the Greens, the Linke and abstention. For robustness, we also report the voter inflows for the AfD to further substantiate that former Social Democrats did not flock towards the Radical Right in meaningful numbers in Germany (Figure SI 3).

Finally, we also looked into whether *specific class backgrounds* might report different patterns of outflows from Social Democrats. Again, looking exemplary into the German case we do not find such a pattern: the outflows across different class backgrounds appear to be fairly similar; with no class background suggesting a meaningful outflow towards the Radical Right (Figures SI 4 - SI 9).

6 Conclusion

In this chapter we set out to empirically assess voter outflows of Social Democratic parties in three countries. We do so by relying on longterm panel data and thereby addressing an important lacuna in research on Social Democracy: where are all the former Social Democrats today?

Public narrative has it that the former core moved on to abstention and then later flocked towards the Radical Right. Empirically we do not find support for this narrative. Social Democrats only flock in small numbers towards the Radical Right. The most common patterns in our analyses are: 1) former Social Democrats more on to abstain from politics altogether 2) they flock to progressive options on the societal dimension (Green and Liberal parties). These patterns are quite comparable across the three cases (Switzerland, Germany and the UK) we study; which is interesting given the diversity of Social Democrats these cases cover.

In the next weeks we want to add a generational/class perspective to the chapter. However, we learned that we often run into small number issues when adding class measures. Similarly first analyses of generational change do not provide striking differences across time but we will continue to work on this as well.
